## 1. Great Circle:

- A great circle is a section of a sphere that contains a diameter of the globe.
- Sections of the sphere that do not contain a diameter are called small circles.
- A great circle becomes a straight line in a gnomonic projection.
- Each meridian and equator is a great circle. The shortest distance between two points on the earth's surface is a great circle route.

It is possible to calculate the shortest distance using the spherical trigonometry equation,

$$
\cos D=\left(\sin \emptyset_{a}\right)\left(\sin \emptyset_{b}\right)+\left(\cos \emptyset_{a}\right)\left(\cos \emptyset_{b}\right)(\cos \Delta \lambda)
$$

## Where:

$\emptyset_{a}$ Latitude at point a
$\emptyset_{b}$ Latitude at point b
$\Delta \lambda$ Difference of the longitude between a and b , the difference is not necessarily less than 180 .
D is the arc distance (central angle) between points $a$ and $b$.

Example: Find the shortest distance from Pittsburgh (USA) to Peking(China) on the globe with $\mathrm{R}=30 \mathrm{~cm}$.

If it is known that $\emptyset_{a}=40, \lambda_{a}=-80, \emptyset_{b}=$ 40 , and $\lambda_{b}=116$.

Solution:

$$
\begin{gathered}
\Delta \lambda=360-(116+80) \\
\cos D=\left(\sin \emptyset_{a}\right)\left(\sin \emptyset_{b}\right)+\left(\cos \emptyset_{a}\right)\left(\cos \emptyset_{b}\right)(\cos \Delta \lambda)
\end{gathered}
$$

$\cos D=(\sin 40)(\sin 40)+(\cos 40)(\cos 40)(\cos 164)=-0.1509$
$\mathrm{D}=98.68^{\circ}$
Surface Distance $=(2 \Pi 30 / 360) 98.68^{\circ}=51.7 \mathrm{~cm}$.
And the average length of a degree on a great circle is
Surface Distance $=(2 \Pi 6370 / 360) 98.68^{\circ}=10,971 \mathrm{~km}$.
And the length of a 1 -second arc is about 30.88 m
2. Loxodrome or rhumb line, although a great circle provides the shortest possible route between two points, it may be a challenging route to follow if navigating manually by compass. Therefore, in flying, it would be simpler to follow the route with constant bearing ( on the line called follow Loxodrome or rhumb line) than following the route with changing the bearing (on great circle )

## 3. Spherical triangle

It is a closed figure formed on the surface of a sphere bounded by three arcs of great circles.

The great circle is defined to be the intersection of a sphere with a plane containing the centre of the sphere

- The three arcs of great circles are the sides of the spherical triangle, denoted by lowercase letters $a, b$, and c .
- The spherical angles formed by the arcs of great circles are called the angles of the spherical triangle, denoted
 by the uppercase letters $\mathrm{A}, \mathrm{B}$, and C .
- A trihedron $\mathrm{O}-\mathrm{ABC}$ is formed by connecting the vertices of the spherical triangle ABC with the centre of the sphere O .
- The radian measure of a central angle of a circle is equivalent to the length of the arc the angle subtends, which yields:

$$
a=\angle B O C, b=\angle A O C, c=\angle A O B .
$$

Given are:

$$
A=\angle T A T^{\prime}, B=\angle E B E^{\prime}, C=\angle F C F^{\prime} .
$$

## The Spherical Law of Sines formula:

$(\sin a / \sin A)=(\sin b / \sin B)=(\sin c / \sin C)$

The Spherical Law of Cosines formula:
$\cos a=\cos b \cos c+\sin b \sin c \cos A$

The amount by which the sum of the angles of a spherical triangle exceeds the sum of the angles of a plane triangle is called Spherical Excess and is denoted by $\varepsilon$ :

$$
\varepsilon=\mathrm{A}+\mathrm{B}+\mathrm{C}-180----(1)
$$

The computational formula of $\varepsilon$ is given by:

$$
\varepsilon=\frac{S}{R^{2}}-----(2)
$$

Where S denotes the area of the spherical triangle and R is the radius of the sphere.
The value of $\varepsilon$ is in radian to convert it to second multiply by $180 / \mathrm{pi} * 3600=206264.81$ "
Use the below formula to correct the surface angles:

$$
\left.\begin{array}{l}
A_{1}=A_{0}-\varepsilon^{\prime \prime} / 3 \\
B_{1}=B_{0}-\varepsilon^{\prime \prime} / 3 \\
C_{1}=C_{0}-\varepsilon^{\prime \prime} / 3
\end{array}\right\},
$$

Ex: Calculate the spherical excess and adjust the angles
From $\mathrm{a}=24512 \mathrm{~m}, \mathrm{~b}=34930 \mathrm{~m}$, and, $c=36621 \mathrm{~m}$. use $\mathrm{R}=6371 \mathrm{~km}$.
$\mathrm{a}_{1}=\mathrm{pi} / 180 * \mathrm{a}^{0} * \mathrm{R}$
then $\mathrm{a}^{\circ}=0^{\circ} 13^{\prime} 13.59^{\prime \prime} ; \mathrm{b}^{\mathrm{o}}=0^{\circ} 18^{\prime} 50.88^{\prime \prime}$, and , $\mathrm{c}^{\circ}=0^{\circ} 19^{\prime} 45.63^{\prime \prime}$
Calculate surface angles (A,B,C)

$$
\cos (A)=\frac{\cos (a)-\cos (b) * \cos (c)}{\sin (b) * \sin (c)}
$$

$$
\cos (A)=\frac{\cos \left(0 \mathrm{o} 13^{\prime} 13.59^{\prime \prime}\right)-\cos \left(0 \mathrm{o} 18^{\prime} 50.88^{\prime \prime}\right) * \cos \left(0 \mathrm{o} 19^{\prime} 45.63^{\prime \prime}\right)}{\sin \left(0 \mathrm{o} 18^{\prime} 50.88^{\prime \prime}\right) * \sin \left(0 \mathrm{o} 19^{\prime} 45.63^{\prime \prime}\right)}
$$

$\mathrm{A}=39^{\circ} 58^{\prime} 50.06^{\prime \prime}$
$\cos (B)=\frac{\cos (b)-\cos (a) * \cos (c)}{\sin (a) * \sin (c)} \Rightarrow \mathrm{B}=66^{\circ} 17^{\prime} 33.71^{\prime \prime}$
$\cos (C)=\frac{\cos (c)-\cos (a) * \cos (b)}{\sin (a) * \sin (b)} \rightarrow \mathrm{C}=73^{\circ} 43^{\prime} 38.31^{\prime \prime}$

| Angle | Value | Correction. | Corrected angles |
| :--- | :--- | :--- | :--- |
| A | $39^{\circ} 58^{\prime} 50.06^{\prime \prime}$ | -0.69 | $39^{\circ} 58^{\prime} 49.37^{\prime \prime}$ |
| B | $66^{\circ} 17^{\prime} 33.71^{\prime \prime}$ | -0.69 | $66^{\circ} 17^{\prime} 33.02^{\prime \prime}$ |
| C | $73^{\circ} 43^{\prime} 38.31^{\prime \prime}$ | -0.70 | $73^{\circ} 43^{\prime} 37.61^{\prime \prime}$ |
| Sum | $180^{\circ} 00^{\prime} 2.08^{\prime \prime}$ | -2.08 | $180^{\circ} 00^{\prime} 00^{\prime \prime}$ |

Spherical excess=+2.08"
Correction $=2.08 " / 3=0.693 "$
