

## Chapter One / Home works

**Q1/** State the number of neutrons, protons and the amount of charge in each of the following nuclei;  ${}_3^7\text{Li}$ ,  ${}_{10}^{22}\text{Ne}$ ,  ${}_{40}^{94}\text{Zr}$ ,  ${}_{72}^{180}\text{Hf}$ .

**Q2/** Calculate the density of nuclear matter in units of: tons/  $\text{mm}^3$ , nucleons /  $\text{fm}^3$ .

**Q3/** Calculate the distance of closet approach of alpha particle of kinetic energy 25 MeV from uranium  ${}_{92}^{235}\text{U}$  in head collision and which is scattered at angle  $180^\circ$ .

**Q4/** A beam of  $\alpha$  -particles (kinetic energy 5.3 MeV) from  ${}_{84}^{214}\text{Po}$ , of intensity  $10^4$  particles / sec is incident normally on a gold foil of density  $19.3 \text{ g/cm}^3$  and  $10^{-5} \text{ cm}$  thick. What is the number of scattered particles per second per unit area at angle  $60^\circ$ , at a distance of 10 cm from the foil?

**Q5/** What nuclei have radius equal to one-half the radius of  ${}_{92}^{236}\text{U}$  nucleus?

**Q6/** calculate the nuclear radius of  ${}_{47}^{107}\text{Ag}$ ,  ${}_{92}^{235}\text{U}$  nucleus in fermi meter (fm) and meters.

**Q7/** Calculate the nuclear matter density of the  ${}^{12}\text{C}$  nucleus in units of  $\text{Kg / m}^3$ .

## Chapter Two / Home works

**Q1/** Calculate the total binding energy and the average binding energy per nucleon for  ${}_8^{16}\text{O}$  nucleus.

Given that:  $M({}_8^{16}\text{O}) = 15.9949 \text{ amu}$ ,  $M({}_1^1\text{H}) = 1.007825 \text{ amu}$ ,  $M({}_0^1\text{n}) = 1.008665 \text{ amu}$

**Q2 /** Calculate the separation energy of proton from  ${}_8^{16}\text{O}$  nucleus. given that:

$M({}_8^{16}\text{O}) = 15.9949 \text{ amu}$ ,  $M({}_7^{15}\text{N}) = 15.0001 \text{ amu}$ ,  $M({}_1^1\text{H}) = 1.007825 \text{ amu}$

**Q3/** Calculate the separation energy of neutron from  ${}_8^{16}\text{O}$  nucleus, given that:

$M({}_8^{16}\text{O}) = 15.9949 \text{ amu}$ ,  $M({}_8^{15}\text{O}) = 15.003 \text{ amu}$ ,  $M(\text{n}) = 1.008665 \text{ amu}$

**Q4/** Calculate the value of: (a) mass defect for uranium  ${}_{92}^{235}\text{U}$ . (b) the mass excess for  ${}_{92}^{235}\text{U}$ .

**Q5/** Show that for a nucleus  ${}_Z^AX$ : the separation energy of neutron is ;

$$S_n = B.E_{tot}(A, Z) - B.E_{tot}(A - 1, Z)$$

**Q6/** Calculate the binding energy and average binding energy per nucleon for then nucleus of  ${}_{92}^{235}\text{U}$  and  ${}_2^4\text{He}$ .

**Q7/** Calculate the separation energy of the neutron and proton from  ${}_{26}^{57}\text{Fe}$ .

**Q8/** The binding energy of neon isotope  ${}_{10}^{20}\text{Ne}$  is 160.647 MeV. Find its atomic mass.

**Q9/** Find the mass defect and mass excess of  ${}_2^4\text{He}$  nucleus.

Q10 / Show that 1 amu unit is equivalent to 931.48 MeV .

Q11/ Calculate the rest mass energy of proton in joule and MeV units.

Q12 / Show that for a nucleus  ${}^A_ZX$ , the separation energy of neutron  $S_n$  is:

$$S_n = B.E(A, Z) - B.E(A-1, Z) .$$

### Constants

Mass of hydrogen atom  $M_H = 1.007825$  amu

Mass of neutron  $M_n = 1.008665$  amu

Mass of  ${}_{92}^{235}U$  atom = 235.0439 amu

Mass of helium atom  $M({}_2^4He) = 4.002603$  amu

Mass of iron atom  $M({}_{26}^{57}Fe) = 56.935396$  amu

Mass of iron atom  $M({}_{26}^{56}Fe) = 55.934939$  amu

Mass of Manganese atom  $M({}_{25}^{56}Mn) = 55.938907$  amu

1 atomic mass unit ( 1 amu) =  $1.66 \times 10^{-27}$  Kg.

### Chapter Three / Home works

Q1/ Calculate the value of nuclear magneton ( $\mu_N$ ) in units of  $J T^{-1}$  and  $eV T^{-1}$  , where (T ) is tesla .

Q2/ Calculate the total binding energy of  ${}_{13}^{27}Al$  nucleus from the semi-empirical binding energy formula .

Q3/ According to single particle model (shell model), what is the spin and parity of the ground state of  ${}_{19}^{39}K$  nucleus.

Q4/ Calculate the repulsive potential energy due to coulomb force among the protons of  ${}_{92}^{235}U$  nucleus.

Q5 / Calculate the binding energy of  ${}_4^9Be$  nucleus from semi –empirical binding energy formula .

Q6 / Calculate the mass of  ${}_4^9Be$  nucleus from the semi –empirical mass formula.

Q7 / from semi-empirical binding energy formula derive an expression for the average binding energy for a nucleus with mass number **A** and atomic number **Z**.

Q8/ According to the shell model, what is the expected spin and parity of the ground state of ;  ${}_{20}^{40}Ca$  ,  ${}_{21}^{43}Ca$  nuclei.

### Chapter Four/ Homework's

Q1 / The half-life of  ${}^{226}Ra$  is 1620 years, Calculate;

a) The decay constant of  ${}^{226}Ra$  in units of  $sec^{-1}$

b) The number of radioactive atoms in 1g of  ${}^{226}Ra$ .

c) The activity of 1g of  ${}^{226}Ra$ .

**Q2/** One milligram of polonium-210 ( $^{210}\text{Po}$ ), half-life 138.3 days, is allowed to decay for 1 Year, what is its activity at the end of that time?

**Q3//**

As an example, consider a piece of wood, weighing 50 g, which has an activity of 320 disintegrations/minute from  $^{14}\text{C}$ . The corresponding activity in a living plant is 12 disintegrations/minute/gm, and we wish to determine the age of the wood. (The half-life of  $^{14}\text{C}$  is  $t_{\frac{1}{2}} = 5730 \text{ yr}$ , and  $\lambda = \frac{0.693}{t_{\frac{1}{2}}}$ .) We are given that the initial and current activities are

$$\begin{aligned} \mathcal{A}(t = 0) &= 12/\text{min}/\text{gm}, \\ \mathcal{A}(t) &= \frac{320}{50}/\text{min}/\text{gm}. \end{aligned}$$

From the definition of activity, we can relate the activities at our two times as follows

$$\mathcal{A}(t) = \left| \frac{dN}{dt} \right| = \lambda N(t) = \lambda N_0 e^{-\lambda t} = \mathcal{A}(t = 0) e^{-\lambda t}.$$

Therefore, we obtain

$$\begin{aligned} \lambda t &= \ln \frac{\mathcal{A}(t = 0)}{\mathcal{A}(t)}, \\ \text{or } t &= \frac{1}{\lambda} \ln \left( \frac{12 \times 50}{320} \right) \approx \frac{5730 \text{ yr}}{0.693} \times 0.626 \\ &\approx 5170 \text{ years}. \end{aligned}$$

In other words, the piece of wood is about 5170 years old. Recently, carbon dating techniques have greatly improved through the use of nuclear mass

**Q 4/** calculate the mean life-time for  $^{210}\text{Po}$  nucleus

**Q5/** The half-life of radioactive  $^{60}\text{Co}$  is 5.26 years. What is the activity of a 1g sample of  $^{60}\text{Co}$  in units of curie, and its activity after 5.26 Years?

**Q6/** The half-life of radon 222 ( $^{222}\text{Rn}$ ) is 3.85 days. How long it take for 60 percent (60%) of a sample of radon ( $^{222}\text{Rn}$ ) to decay?

**Q7 /** Derive an expression for the relation between lifetime ( $\tau$ ) and half-life time  $t_{1/2}$ .

**Q8/** The activity of a certain radio nuclide decreases to 15 percent of its original value in 10 days. Find its half-life.

**Q9/** The activity of 20 g of  $^{232}\text{Th}$  is  $2.18 \mu\text{ci}$ . Calculate the disintegration constant and the half-life of  $^{232}\text{Th}$ .

### Chapter Five/ HOME WORKS

**Q1/**  $^{240}_{94}\text{P}$  decays with a half-life of 6760 years by emitting two groups of alpha particles, with energy 5.17 MeV and 5.12 MeV.

- What are the decay energy (disintegration energy)?
- Calculate the recoil kinetic energy of the daughter nucleus.

**Q2/** Show that a radioactive isotope  $^{64}_{29}\text{Cu}$  satisfied the conditions for decaying by  $\beta^-$ ,  $\beta^+$  and electron capture processes .

**Q3/** Calculate the maximum kinetic energy of electron,  $T_e(\text{max})$  , and positron ,  $T_{e^+}$  ,in the  $\beta^-$  - decay , and  $\beta^+$ -decay of  $^{64}_{29}\text{Cu}$  .

**Q4/** What is the most predominate multipole transition in the  $2^+ \rightarrow 2^+$  gamma transition ?

**Q5/**  $^{137}_{55}\text{Cs}$  decays by  $\beta^-$  - emission ,as shown in the figure .When the nucleus left in excited state, its decay to the ground state via gamma transition .What are the energies between of the beta

### Chapter Six / HOME WORKS

**Q1/** Complete each of the following nuclear reactions;

**Q2/** Find the Q-value of the reaction  $^9_4\text{Be} (\alpha, n) ^{12}_6\text{C}$ . Given that:

$M(^9\text{Be})=9.015$  amu ,  $M(\alpha)=4.00387$  amu ,  $M(n)=1.00898$  amu ,  $M(^{12}\text{C})=12.003$  amu

**Q3 /** The Q-value for a given reaction  $^{19}_9\text{F} (n, p) ^{19}_8\text{O}$  is  $-3.9$  MeV, and the energy of incident neutron  $10$  MeV. What is the energy of the emitted protons that are observed at angle  $90^\circ$  to the direction of the incident neutrons?

**Q4/** In question3, the Q-value of the reaction  $-3.9$  MeV, what is the threshold energy? Given the atomic mass of  $M(^{19}\text{F})=18.9984$  amu .

**Q5 /** What thickness of  $^{27}_{13}\text{Al}$  is need to reduce the intensity of an incident beam of  $0.025$  eV neutrons to one tenth of its initial intensity? The density of aluminum is  $2.7$  g/cm<sup>3</sup>, atomic weight  $26.98$  and its cross section for  $0.025$  eV neutron is  $0.23$  b.

### Chapter Seven / HOME WORKS

**Q1/** Calculate the amount of energy available (in MeV and Joules) if one gram of  $^{235}_{92}\text{U}$  is completely fission. The energy release of fission of 1 atom of  $^{235}_{92}\text{U}$  (energy per fission) is  $235$  MeV/ fission.

**Q2/** Show that the complete fission of 1 g of  $^{235}_{92}\text{U}$  would produce energy at amount of  $2.27 \times 10^4$  KW.h.

**Q3/** Calculate the amount of energy release in the fusion reaction;
