

Q.1) Choose the correct answer: ( **ONLY 10** )

[10 Marks]

1. Identify which of the following quantities can be described fully by its magnitude.

**Displacement, Force, Velocity, Distance**

2. The dimensions of Focal length is same as that of

**Force, Pressure, Wavelength, Work**

3. If  $F_1 = -20\hat{j}$ ,  $F_2 = -10\hat{i}$ , and  $F_3 = 5\hat{i} + 10\hat{j}$ , what is the sum  $F_1 + F_2 + F_3$  ?

**$-15\hat{i} + 10\hat{j}$ ,  $-5\hat{i} - 10\hat{j}$ ,  $5\hat{i}$ ,  $5\hat{i} - 10\hat{j}$**

4. Which of the following has the smallest inertia?

**An electron, a paper, an atom, a book**

5. Two physical quantities whose dimensions are same, can be:

**Added or subtracted, Multiplied with each other, Divided, all of them.**

6. Which of the following is not a unit of temperature?

**Celsius, Farad, Fahrenheit, Kelvin**

7. A ball is dropped from a height 'h' above the ground. Its speed just before hitting the ground will be:

**$\sqrt{2gh}$ ,  $\sqrt{2g(h-y)}$ ,  $2gh$ ,  $2g(h-y)$**

8. If the work done on a system is positive, energy is

**transfer from the system, remains constant, transfer to the system, none of them**

9. The energy associated with an objects temperature is:

**Potential energy, kinetic energy, mechanical energy, internal energy.**

10. The gravitational force between two particles ..... with increase the distance between them.

**Increase, decrease, depend on the particles masses, remain constant.**

11. Which of the following is not the name of physical quantity?

**Kilogram, Density, Force, Energy**

Q.2) Give a short answer for the following:

[10 Marks]

1. What is the difference between Vector and Sculler quantities in physics?

Scalars are quantities that are fully described by a magnitude (or numerical value) alone. Vectors are quantities that are fully described by both a magnitude and a direction.

2. What is the difference between isolated and non-isolated system?

An isolated system is one that does not exchange energy or matter with its surroundings, while a non- isolated system does allow for such exchanges.

3. Starting from Universal Gravitational constant (G), find gravity due to earth (g).

$$mg = G \frac{M_E m}{R_E^2} \rightarrow g = G \frac{M_E}{R_E^2}$$

Substitute for the mass of earth  $M_E = 5.98 \times 10^{24}$  kg and the radius of the earth  $R_E = 6.38 \times 10^6$  m

$$\therefore g = G \frac{M_e}{R_e^2} = 6.67 \times 10^{-11} \frac{5.98 \times 10^{24}}{6.38 \times 10^6} = 9.8 \text{ m/s}^2$$

4. Force classified into two groups; mention them and give an example to each of them.

a. contact force (push, pull, hit, shoot)

b. field force (electric force, nuclear f., magnetic f. , gravitational f.)

5. Assume two objects connected by a light string on Atwood's Machine as shown in the figure.

What is the relation between their acceleration  $a_1$  and  $a_2$  ?

What is the relation between the tension force upon each string?

$$a_1 = a_2$$

$$T_1 = T_2$$

**Q.3A)** Check the following equation is it dimensionally correct or not?

[5 Marks]

$$x = x_0 + vt + (1/2) at^2$$

where,  $x$  is displacement at given time  $t$

$x_0$  is the displacement at  $t = 0$ ,  $v$  is the velocity at  $t = 0$ ,  $a$  represents the acceleration

Checking the dimensions on both sides, L.H.S. =  $[M^0L^1T^0]$

$$\text{R.H.S.} = [LT^{-1}][T] + [LT^{-2}][T^2] = [M^0L^1T^0] + [M^0L^1T^0] = [M^0L^1T^0]$$

Comparing the L.H.S. and R.H.S.

Hence the formula is dimensionally correct.

**Q.3B)** The Cartesian coordinates of a point in the  $(x,y) = (-3.5, -2.5)$  m. Find the polar coordinates  $(r,\theta)$  of this point. [5 Marks]

$$\begin{aligned} r &= \sqrt{x^2 + y^2} \\ &= \sqrt{(-3.50 \text{ m})^2 + (-2.50 \text{ m})^2} \\ &= 4.30 \text{ m} \end{aligned}$$

and from Equation 3.3,

$$\tan \theta = \frac{y}{x} = \frac{-2.50 \text{ m}}{-3.50 \text{ m}} = 0.714$$
$$\theta = 216^\circ \quad (\text{signs give quadrant})$$

**Q4)** Calculate the minimum energy required to send a 3000kg spacecraft from the earth to a distance point in space where earth's gravity is negligible.

If the journey takes three weeks, what average power would the engine have to supply? [10 Marks]

$$\begin{aligned} \text{(a)} \quad v_{esc} &= \sqrt{\frac{2GM_e}{R_e}} = 1.12 \times 10^4 \text{ m/s} \\ K &= \frac{1}{2}mv_{esc}^2 = \frac{1}{2} \times 3000 \times (1.12 \times 10^4)^2 \\ &= 1.88 \times 10^{11} \text{ J} \end{aligned}$$
$$\text{(b)} \quad P_{av} = \frac{K}{\Delta t} = \frac{1.88 \times 10^{11}}{21 \text{ days} \times 8.64 \times 10^4 \text{ s/day}} = 103 \text{ kW}$$

**Q.5)** Find the resultant of the three displacement vectors in Fig. by means of the component method. The magnitudes of the vectors are  $A = 5 \text{ m}$ ,  $B = 5 \text{ m}$  and  $C = 4 \text{ m}$ . **[10 Marks]**

$$\begin{aligned}
 A_x &= -(5.00 \text{ m}) \cos(20.0^\circ) = -4.698 \text{ m} \\
 A_y &= +(5.00 \text{ m}) \sin(20.0^\circ) = +1.710 \text{ m} \\
 B_x &= +(5.00 \text{ m}) \cos(60.0^\circ) = +2.500 \text{ m} \\
 B_y &= +(5.00 \text{ m}) \sin(60.0^\circ) = +4.330 \text{ m} \\
 C_x &= 0 \quad \text{and} \quad C_y = -4.00 \text{ m}
 \end{aligned}$$

The resultant (sum) of all three vectors (which we call R)

$$\begin{aligned}
 R_x &= A_x + B_x + C_x \\
 &= -4.698 \text{ m} + 2.500 \text{ m} + 0 \text{ m} \\
 &= -2.198 \text{ m} \\
 R_y &= A_y + B_y + C_y \\
 &= +1.710 \text{ m} + 4.330 \text{ m} - 4.000 \text{ m} \\
 &= 2.040 \text{ m}
 \end{aligned}$$

$$\begin{aligned}
 R &= \sqrt{R_x^2 + R_y^2} \\
 &= 3.00 \text{ m} \\
 &= \sqrt{(-2.198 \text{ m})^2 + (2.040 \text{ m})^2}
 \end{aligned}$$

If the direction of R (as measured from the +x axis) is  $\theta$ , then

$$\tan \theta = \frac{2.040}{(-2.198)} = -0.928$$

$$\theta = -42.9^\circ + 180^\circ = 137.1^\circ$$

*Earth/Radius = 6,371 km*

*Earth/Mass =  $5.972 \times 10^{24} \text{ kg}$*

*$G = 6.674 \times 10^{-11} \text{ N}\cdot\text{m}^2/\text{kg}^2$*

*Good luck*

*Lecturer: Jala Muhamed*
