

Blood, Cartilage & Bone

Lab 7

Blood Connective Tissue

- **Blood** is a **fluid** connective tissue that circulates through the body.
- **Blood** is composed of **red blood cells** (RBC), **white blood cells** (WBC), **platelets**, and **plasma**.
- It is considered a **connective tissue** for two basic reasons:
 1. Embryologically, it has the same origin (mesodermal).
 2. Connects the body system together.

Classification of blood cells

- Enucleated **erythrocyte** [Red Blood Cell (RBC)].
- Nucleated **leukocyte** [White Blood Cell (WBC)].

Classification of white blood cells:

White blood cells are divided into **granulocytes** & **agranulocytes**, distinguished by the presence or absence of granules in the cytoplasm.

- **Granulocytes** include Neutrophils, basophils and Eosinophils.
- **Agranulocytes** include Lymphocytes and Monocytes.

Granulocyte = Neutrophil

- **60 - 70%** of WBCs.
- Have **3 - 4 lobes** connected by tapering chromatin strands.

Multi-lobed Nucleus

Granulocyte = Basophil

- 0.5 - 1% of circulating WBCs.
- Bilobed.

Granulocyte = Eosinophil

- 1 - 4% of WBCs.
- Are bilobed nucleus.

Agranulocyte = Lymphocyte

- 20 - 40 % of the WBCs.
- Has a round nucleus and a small amount of cytoplasm.

Agranulocyte = Monocyte

- **1 - 10%** of the circulating WBCs.
- Their nucleus is **large** and **kidney bean-shaped**.

Supporting connective tissue

- **Cartilage** is a relatively solid, non-vascularized tissue.
- During the development of the fetus, it plays a major role since most of **axial skeleton** is laid down as cartilage in the embryo.
- This cartilage is **replaced** by **bone**. After **post-natal** growth **ceases**.
- Cartilage is found in only two general areas of the body:
 1. **Extra-skeletal** (nose, ear & trachea).
 2. Covering the **caps of bones** in movable joints.

Cartilage:

- Jelly-like matrix (**chondroitin sulfate**) containing **collagen** & **elastic fibers** and **chondrocytes** surrounded by a membrane called the **perichondrium**.
- Unlike other CT, cartilage has **NO blood vessels** or **nerves** except in the perichondrium.
- The **strength** of cartilage is due to collagen fibers and the **resilience** is due to the presence of chondroitin sulfate.
- **Chondrocytes** occur within spaces in the matrix called **lacunae**.

Types of cartilage

- **Hyaline cartilage**
- **Fibrous cartilage**
- **Elastic cartilage**

Hyaline Cartilage (most abundant type)

- **Fine collagen fibers** embedded in a gel-type **matrix**. Occasional chondrocytes inside lacunae.
- **Found** in embryonic skeleton, at the ends of long bones, in the nose and in respiratory structures.
- **Function:** flexible, provides support, allows movement at joints.

HYALINE CARTILAGE

LOCATIONS: Between tips of ribs and bones of sternum; covering bone surfaces at synovial joints; supporting larynx (voice box), trachea, and bronchi; forming part of nasal septum

FUNCTIONS: Provides stiff but somewhat flexible support; reduces friction between bony surfaces

(a) Hyaline cartilage

Chondrocytes
in lacunae

Matrix

LM × 500

Fibrous cartilage

- Contains **bundles of collagen** in the matrix that are usually more visible under microscopy.
- **Found** in the pubic symphysis, intervertebral discs, and menisci of the knee.
- **Function**: support and fusion, and absorbs shocks.

FIBROUS CARTILAGE

LOCATIONS: Pads within knee joint; between pubic bones of pelvis; intervertebral discs

FUNCTIONS: Resists compression; prevents bone-to-bone contact; limits relative movement

(c) Fibrous cartilage

Collagen fibers in matrix

Chondrocyte in lacuna

LM × 1000

Elastic Cartilage

- Threadlike network of **elastic fibers** within the matrix.
- **Found** in external ear, auditory tubes & epiglottis.
- **Function**: gives support, maintains shape, allows flexibility.

ELASTIC CARTILAGE

LOCATIONS: Auricle of external ear; epiglottis; auditory tube; cuneiform cartilages of larynx

FUNCTIONS: Provides support, but tolerates distortion without damage and returns to original shape

(b) Elastic cartilage

Chondrocyte in lacuna

Elastic fibers in matrix

LM × 358

Cartilages in the Adult Body

(a) Hyaline cartilage (180×)

(b) Elastic cartilage (470×)

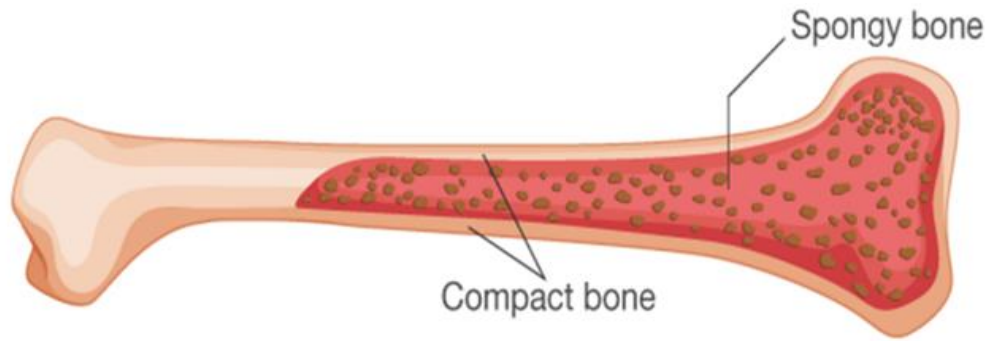

(c) Fibrocartilage (285×)

Bone

- Composes most of the **adult skeleton**. Its rigidity is produced by the decrease of amorphous matrix components, an increase in collagenous fibers and the **calcification** of the matrix.
- Two types of bone, based on the **density** or amount of **space** between calcified tissues, are found in the body:
 1. **Compact (dense) bone.**
 2. **Spongy (cancellous) bone.**

Difference between Spongy and Compact bones

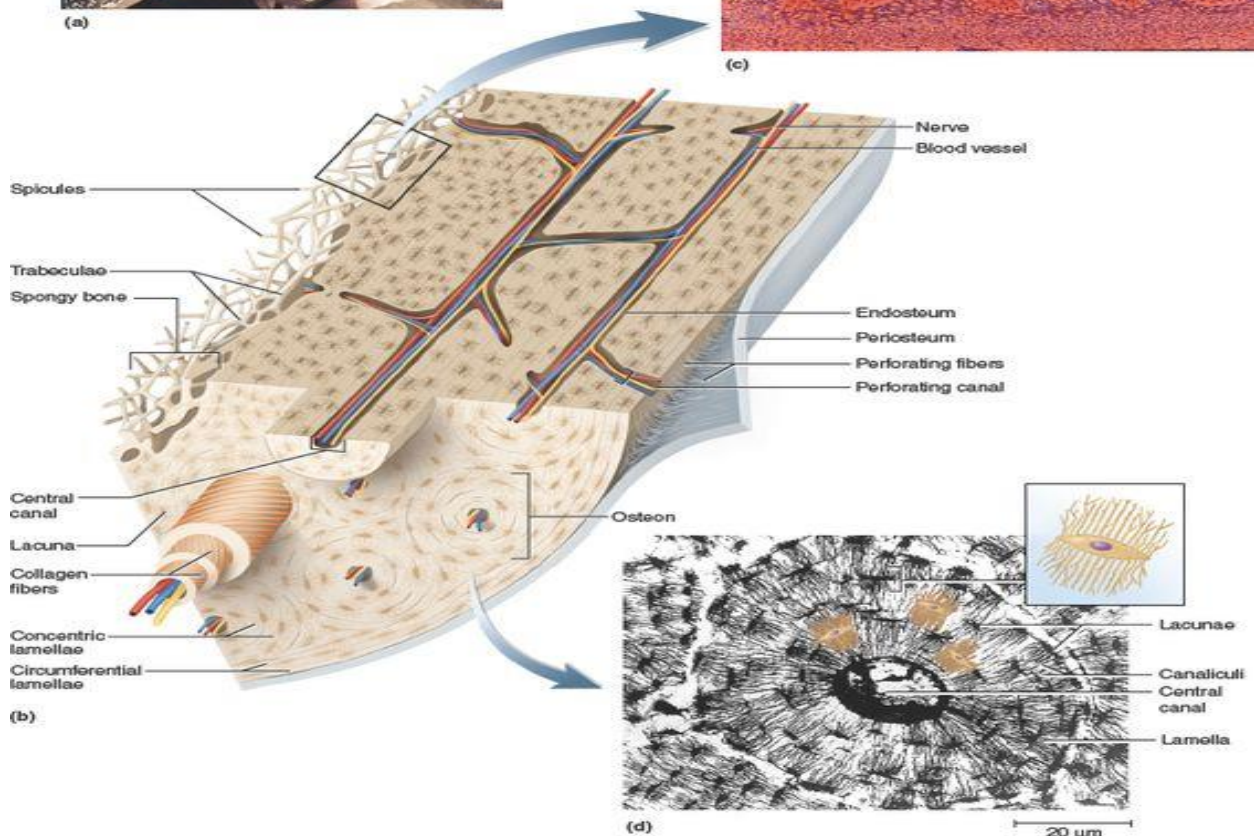

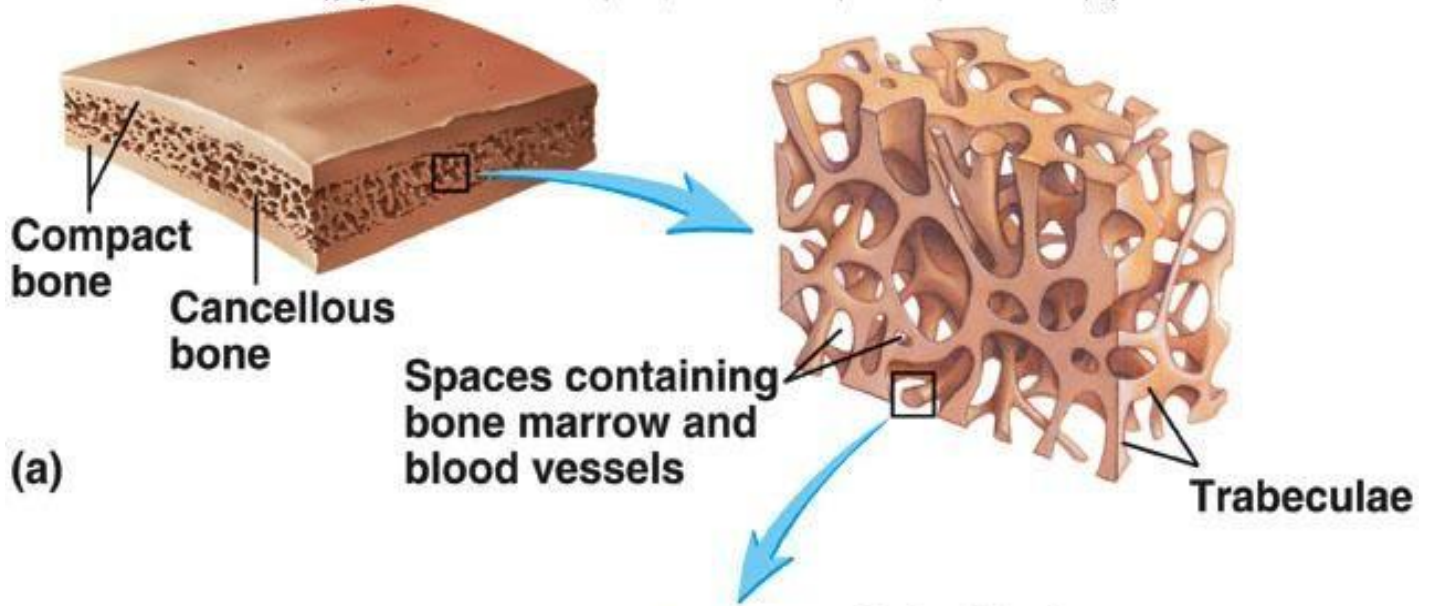

SPONGY BONE

- Spongy bone is also called cancellous or trabecular bone. It is found in the long bones and it is surrounded by compact bone.

COMPACT BONE

- Compact bone, also called cortical bone, surrounds spongy bone. They are heavy, tough and compact in nature
