Aknowledgment

*I would like to thanks Allah for giving me the power to complete this work And I would like to present my profound thanks to supervisor and lecturer **Assist.Prof.Dr.Nehmat K. Ahmad** for his kind valuable suggestions that assisted me to accomplish this work I would also like to extend my gratitude to the head of mathematic department **Assist.Prof.Dr.Rashad Rashid Haji**, and especially thanks for my family to support me and make me what am I today ,and thanks all my friends*

Abstract

In this report we have of set which contain three and four elements $X=\{a,b,c\}$

And $x=\{a,b,c,d\}$

Which the 3 element has 9 comparable topology elements and four element has 33 comparable topology and we try to obtain the S_p open set in topological space

Introduction

Semi-open sets, preopen sets, α -open sets, b-open sets and β -open sets play an important role for the study and investigation in topological spaces. In 1963, Levine [6] introduced the concept of semi-open sets in topological spaces. After the work of Levine on semi-open sets, several mathematicians turned their attention to the generalizations of various concepts of topology by considering semi-open sets instead of open sets. While open sets are replaced by semi-open sets, new results are obtained in some occasions and in other occasions substantial generalizations are exhibited. In this direction, in 1975, Maheshwari and Prasad [7], used semi-open sets to define and investigate three new separation axioms called semi-T0, semi-T1 and semi-T2. Later, in 1987, Bhattacharya and Lahiri [2] generalized the concept of closed sets to semi-generalized closed sets with the help of semi-openness. The notion of α -open sets (originally called α -sets) in topological spaces was introduced by Njåstad [10] in 1965. By using α -open sets, Mashhour et al. [9] defined and studied the notions of α -continuity and α -openness in topological spaces. In 1982, Mashhour et al. [8] introduced and investigated the concepts of preopen sets and precontinuous functions in topological spaces. In 1983, Abd El-Monsef et al. [4] introduced a weak form of open sets called β -open sets. The concept of β -open sets is equivalent to that

Definition 1.1: Topology (KURONYA January 24, 2010)

A topological space is ordered pair (X, π) , where X is a set, π a collection of subsets of X satisfying the following properties

Ø1) $X \in \pi$,

2) if $U, V \in \pi$ implies $U \cap V$,

3) $\{U_\alpha \mid \alpha \in I\}$ implies $\bigcup_{\alpha \in I} U_\alpha \in \pi$.

The collection π is called topology on X , the pair (X, π) a topological space, the elements of π are called open sets.

Definition 1.4: Semi-open (A.A.Nasef Volume 2,2009)

A subset A of a (T.S) is said to be S-open set if $A \subseteq clintA$

Definition 1.5: Pre-open (A.A.Nasef Volume 2,2009)

A subset A of a (T.S) is said to be Pre-open set if $A \subseteq intclA$

Definition 1.6:interior (2019-2018 أ.م. د. يوسف يعكوب يوسف و)

Int A is the largest open set containing

Definition 1.7:closure (2019-2018 أ.م. د. يوسف يعكوب يوسف و)

ClA is the smallest closed set contained in A

Definition.1.8: [1] A subset A of a topological space X is said to be S– open iff $A \subseteq cl int A$.

Definition 1.9: [2] A subset A of a topological space X is said to be p – open iff $A \subseteq int cl A$.

Definition 1.10: *gsp*-closed (A.A.Nasef Volume 2,2009)

A subset A of pre – open set is said to be ***gsp*** – open set of X if for each $x \in A$ there exist a closed set F such that $x \in F \subseteq A$.

Let $X=\{a,b,c\}$

Chapter TWO

Definition2.1: T_0 -Space (أ.م. د. يوسف يعكوب يوسف و 2019-2018)

Let (X, π) be a topological space. Then the space (X, π) is called **gSp T_0 -Space** iff for each pair of distinct points $x, y \in X$ there is either an gSp- open set containing x but not y or an open set containing y but not x . I.e.,

$$X \text{ is gSp } T_0\text{-Space} \leftrightarrow \forall x, y \in X ; x \neq y \exists U \in \text{gSp}O(X) ; (x \in U \wedge y \notin U \vee x \notin U \wedge y \in U).$$

Definition2.2: T_1 -Space (أ.م. د. يوسف يعكوب يوسف و 2019-2018)

Let (X, π) be a topological space. Then the space (X, π) is called **gSp T_1 -Space** iff for each pair of distinct points $x, y \in X$ there is either an gSp- open set containing x but not y And an open set containing y but not x . I.e.,

$$X \text{ is gSp } T_1\text{-Space} \leftrightarrow \forall x, y \in X ; x \neq y \exists U \in \text{gSp}O(X) ; (x \in U \wedge y \notin U \vee x \notin U \wedge y \in U).$$

Definition2.3: T_2 -Space (أ.م. د. يوسف يعكوب يوسف و 2019-2018)

Let (X, π) be a topological space. Then the space (X, π) is called **gSp T_2 -Space** or **Hausdorff space** iff for each pair of distinct points $x, y \in X$ there exist gSp -open sets U And V s.t. $x \in U, y \in V$ And $U \cap V = \emptyset$ I.e.,

$$X \text{ is gSp } T_2\text{-Space} \leftrightarrow \forall x, y \in X ; x \neq y \exists U \in \text{gSp}O(X) ; (x \in U \wedge y \notin U) \vee (x \notin U \wedge y \in U).$$
