Some Notes about Partial Derivatives

1. If $z = f(x)$, a function of single independent variable x , we get dz/dx .

2. If $z = f(x_1, x_2, \dots, x_n)$, a function of two or more independent variables

$$x_1, x_2, \dots, x_n, \text{ we get } \frac{\partial z}{\partial x_1}, \frac{\partial z}{\partial x_2}, \dots, \frac{\partial z}{\partial x_n}$$

3. If $z = u + v$, where $u = f(x, y)$, $v = \phi(x, y)$ then z is a function of x and y .

$$\frac{\partial z}{\partial x} = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial x}; \quad \frac{\partial z}{\partial y} = \frac{\partial u}{\partial y} + \frac{\partial v}{\partial y}$$

4. If $z = uv$, where $u = f(x, y)$, $v = \phi(x, y)$ then:

$$\frac{\partial z}{\partial x} = \frac{\partial}{\partial x}(uv) = u \frac{\partial v}{\partial x} + v \frac{\partial u}{\partial x}; \quad \frac{\partial z}{\partial y} = \frac{\partial}{\partial y}(uv) = u \frac{\partial v}{\partial y} + v \frac{\partial u}{\partial y}$$

5. If $z = \frac{u}{v}$, where $u = f(x, y)$, $v = \phi(x, y)$ then:

$$\frac{\partial z}{\partial x} = \frac{\partial}{\partial x} \left(\frac{u}{v} \right) = \frac{v \frac{\partial u}{\partial x} - u \frac{\partial v}{\partial x}}{v^2}; \quad \frac{\partial z}{\partial y} = \frac{\partial}{\partial y} \left(\frac{u}{v} \right) = \frac{v \frac{\partial u}{\partial y} - u \frac{\partial v}{\partial y}}{v^2}$$

Higher Order Partial Derivatives

Since the first order partial derivatives $\frac{\partial z}{\partial x}$ and $\frac{\partial z}{\partial y}$ are themselves function of \mathbf{x} and \mathbf{y} they can be further differentiated partially w.r.t \mathbf{x} as well as \mathbf{y} . These are called second order partial derivatives of \mathbf{z} . The usual notations for these second order derivatives are:

$$\frac{\partial}{\partial x} \left(\frac{\partial z}{\partial x} \right) = \frac{\partial^2 z}{\partial x^2} \quad \text{or} \quad f_{xx}(\mathbf{x}, \mathbf{y});$$

$$\frac{\partial}{\partial y} \left(\frac{\partial z}{\partial y} \right) = \frac{\partial^2 z}{\partial y^2} \quad \text{or} \quad f_{yy}(\mathbf{x}, \mathbf{y})$$

$$\frac{\partial}{\partial y} \left(\frac{\partial z}{\partial x} \right) = \frac{\partial^2 z}{\partial y \partial x} \quad \text{or} \quad f_{xy}(\mathbf{x}, \mathbf{y});$$

$$\frac{\partial}{\partial x} \left(\frac{\partial z}{\partial y} \right) = \frac{\partial^2 z}{\partial x \partial y} \quad \text{or} \quad f_{yx}(\mathbf{x}, \mathbf{y})$$

$$\frac{\partial^2 z}{\partial x \partial y} = \frac{\partial^2 z}{\partial y \partial x} \quad \text{or} \quad f_{yx}(\mathbf{x}, \mathbf{y}) = f_{xy}(\mathbf{x}, \mathbf{y})$$

$f_{yx} = (f_y)_x$ Differentiate first with respect to \mathbf{y} , then with respect to \mathbf{x}

Higher Order Partial Derivatives

EXAMPLE 1

If $z = x \cos y + y e^x$, find $\frac{\partial^2 z}{\partial x^2}$, $\frac{\partial^2 z}{\partial y \partial x}$, $\frac{\partial^2 z}{\partial y^2}$, $\frac{\partial^2 z}{\partial x \partial y}$

EXAMPLE 2

If $z = x^2 y + \cos y + y \sin x$, find $\frac{\partial^2 z}{\partial x^2}$, $\frac{\partial^2 z}{\partial y \partial x}$, $\frac{\partial^2 z}{\partial y^2}$, $\frac{\partial^2 z}{\partial x \partial y}$

Chain Rule for Functions of Two Variables

The Chain Rule for functions of a single variable says that when $w = f(x)$ is a differentiable function of x and $x = g(t)$ is a differentiable function of t , w is a differentiable function of t and dw/dt can be calculated by the formula:

$$\frac{dw}{dx} = \frac{dw}{dx} \frac{dx}{dt}$$

If $w = f(x, y)$ is differentiable and if $x = x(t)$, $y = y(t)$ are differentiable functions of t , then the composite

$w = f(x(t), y(t))$ is a differentiable function of t and

$$\frac{dw}{dt} = f_x(x(t), y(t)) * x'(t) + f_y(x(t), y(t)) * y'(t)$$

or
$$\frac{dw}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$$
 or
$$\frac{dw}{dt} = \frac{\partial w}{\partial x} \frac{dx}{dt} + \frac{\partial w}{\partial y} \frac{dy}{dt}$$

Chain Rule

Branch Diagram or Tree Diagram

Chain Rule for Functions of Two Variables

$$\frac{dw}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt} \quad \text{or} \quad \frac{dw}{dt} = \frac{\partial w}{\partial x} \frac{dx}{dt} + \frac{\partial w}{\partial y} \frac{dy}{dt}$$
 is called chain

rule for functions of one independent variable t , and two intermediate variables x, y .

The **branch diagram** in the margin provides a convenient way to remember the Chain Rule. The “true” independent variable in the composite function is t , whereas x and y are intermediate variables (controlled by t) and w is the dependent variable.

EXAMPLE 1

Use the Chain Rule to find the derivative of $w = xy$ w.r.t. t along the path $x = \cos t$, $y = \sin t$. What is the derivative's value at $t = \pi/2$?
