# Mathematics III <br> Vectors (Chap. 12) 

Lec 01

Sarkawt H. Muhammad
sarkawt.muhammad@su.edu.krd

## Vectors

- Some of the things we measure are determined simply by their magnitudes.
- To record mass, length, or time, for example, we need only write down a number and name an appropriate unit of measure.
- We need more information to describe a force, displacement, or velocity and it is called a vector.
- To describe a force, we need to record the direction in which it acts as well as how large it is.
- To describe a body's displacement, we have to say in what direction it moved as well as how far.
- To describe a body's velocity, we have to know its direction of motion, as well as how fast it is going

## Vectors (Cont.)

A quantity such as force, displacement, or velocity is called a vector and is represented by a directed line segment. The arrow points in the direction of the action and its length gives the magnitude of the action.

## DEFINITIONS

- The vector represented by the directed line segment $\overrightarrow{\boldsymbol{A B}}$ has initial point $\mathbf{A}$ and terminal point $\mathbf{B}$ and its length is denoted by $|\overrightarrow{A B}|$.
- Two vectors are equal if they have the same length and

Initial
point

Terminal
point direction.

## Vectors (Cont.)

$\mathbf{v}$ is a two-dimensional vector in the plane, the component form $\mathbf{v}$ of is:

$$
\mathbf{v}=\left(v_{1}, v_{2}\right)
$$

$\mathbf{v}$ is a three-dimensional vector in the space, the component form $\mathbf{~ o f ~} \mathbf{v}$ is:

$$
\mathbf{v}=\left(v_{1}, v_{2}, v_{3}\right)
$$

$v_{1}=$ horizontal component, $v_{2}=$ Vertical Component, and $v_{3}=$ perpendicular component.
If $\mathbf{v}$ is two-dimensional with $\mathrm{P}\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)$ and $\mathrm{Q}\left(\mathrm{x}_{2}, \mathrm{y}_{2}\right)$ as points in the plane, then the standard position vector $\mathbf{v}$ is:

$$
\mathbf{v}=\left(\mathrm{x}_{2}-\mathrm{x}_{1}, \mathrm{y}_{2}-\mathrm{y}_{1}\right)
$$

Two vectors are equal if and only if their standard position vectors are identical.

## Vectors Length

The magnitude or length of the vector $\mathbf{v}=\overrightarrow{P Q}$ is the nonnegative number.

$$
|\mathbf{v}|=\sqrt{v_{1}^{2}+v_{2}^{2}+v_{3}^{2}}=\sqrt{\left(x_{2}-x_{1}\right)^{2}+\left(y_{2}-y_{1}\right)^{2}+\left(z_{2}-z_{1}\right)^{2}}
$$

## EXAMPLE 1

Find the (a) component form and (b) length of the vector with initial point $\mathrm{P}(-3$, $4,1)$ and terminal point $Q(-5,2,2)$.

## Vector Algebra Operations

## DEFINITIONS

Let $\mathbf{u}=\left(u_{1}, u_{2}, u_{3}\right)$ and $\mathbf{v}=\left(v_{1}, v_{2}, v_{3}\right)$ be vectors with $k$; scalar.
Addition: $\mathbf{u}+\mathbf{v}=\left(u_{1}+v_{1}, u_{2}+v_{2}, u_{3}+v_{3}\right)$ scalar multiplication: $k \mathbf{u}=\left(\mathrm{k} u_{1}, \mathrm{k} u_{2}, \mathrm{k} u_{3}\right)$

## Vector Algebra Operations (Cont.)

- product $k \mathbf{u}$ of the scalar $k$ and vector $\mathbf{u}$ :

If $k>0$, then $k \mathbf{u}$ has the same direction as $\mathbf{u}$; if $k<0$, then the direction of $k \mathbf{u}$ is opposite to that of $\mathbf{u}$. The length of $k \mathbf{u}$ is the absolute value of the scalar $k$ times the length of $\mathbf{u}$.

$$
\begin{aligned}
|k \mathbf{u}| & =\sqrt{\left(k u_{1}\right)^{2}+\left(k u_{2}\right)^{2}+\left(k u_{3}\right)^{2}}=\sqrt{k^{2}\left(u_{1}^{2}+u_{2}^{2}+u_{3}^{2}\right)} \\
& =\sqrt{k^{2}} \sqrt{u_{1}^{2}+u_{2}^{2}+u_{3}^{2}}=|k||\mathbf{u}| .
\end{aligned}
$$

- The vector $(-1) \mathbf{u}=-\mathbf{u}$ has the same length as $\mathbf{u}$ but points in the opposite direction.
- The difference $\mathbf{u}-\mathbf{v}$ of two vectors is defined by
$\mathbf{u}-\mathbf{v}=\mathbf{u}+(-\mathbf{v})$.
If $\mathbf{u}=\left(u_{1}, u_{2}, u_{3}\right)$ and $\mathbf{v}=\left(v_{1}, v_{2}, v_{3}\right)$, then $\mathbf{u}-\mathbf{v}=\left(u_{1}-v_{1}, u_{2}-v_{2}, u_{3}-v_{3}\right)$

## Properties of Vector Operations

Let $\mathbf{u}, \mathbf{v}, \mathbf{w}$ be vectors and $a, b$ be scalars.
$\mathbf{u}+\mathbf{v}=\mathbf{v}+\mathbf{u}$
$(\mathbf{u}+\mathbf{v})+\mathbf{w}=\mathbf{u}+(\mathbf{v}+\mathbf{w})$
$\mathbf{u}+\mathbf{0}=\mathbf{u}$
$\mathbf{u}+(-\mathbf{u})=\mathbf{0}$
$0 \mathbf{u}=\mathbf{0}$
$1 \mathbf{u}=\mathbf{u}$
$a(b \mathbf{u})=(a b) \mathbf{u}$
$a(\mathbf{u}+\mathbf{v})=a \mathbf{u}+a \mathbf{v}$
$(a+b) \mathbf{u}=a \mathbf{u}+b \mathbf{u}$

## Properties of Vector Operations (Cont.)

We can take advantage of vector properties to make operations, for example:

$$
\begin{aligned}
\mathbf{u}+\mathbf{v} & =\left(u_{1}, u_{2}, u_{3}\right)+\left(v_{1}, v_{2}, v_{3}\right) \\
& =\left(u_{1}+v_{1}, u_{2}+v_{2}, u_{3}+v_{3}\right) \\
& =\left(v_{1}+u_{1}, v_{2}+u_{2}, v_{3}+u_{3}\right) \\
& =\left(v_{1}, v_{2}, v_{3}\right)+\left(u_{1}, u_{2}, u_{3}\right) \\
& =\mathbf{v}+\mathbf{u}
\end{aligned}
$$

## EXAMPLE 2

Let $\mathbf{u}=(-1,3,1)$ and $\mathbf{v}=(4,7,0)$. Find the components of
(a) $2 \mathbf{u}+3 \mathbf{v}$,
(b) $\mathbf{u}-\mathbf{v}$,
(c) $\left|\frac{1}{2} \mathbf{u}\right|$.
