

# The Form & Unity of Street

**Prepared By: Shna Asaad Muhammed**

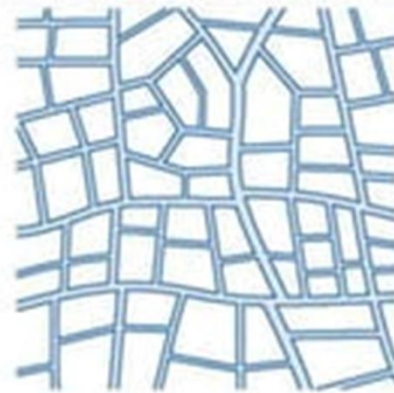

## Street pattern:

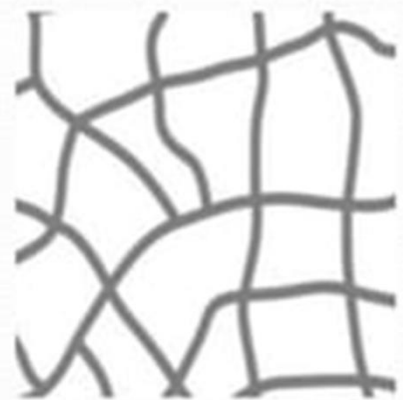

uniform grids

Radial grids

Irregular pattern

organic

Although the uniform grids are easier for traffic.

The irregular and organic patterns are more **interesting** for people because they give them **the sense of discovery**.

## Street length:

- For long distances **the prominent** building will lose its **dominance** and begin to merge into the surroundings.

### The relation between Street proportion and climate:

- If the street locates **in a cold area** it should be **wide** to capture sun light.
- And if the street locates in a **hot country** it should be **narrow** with high buildings to provide **shading** and temper the heat of the site.

## UNITY IN STREET DESIGN

Unity means the sense of continuity and harmony.

- The most important factor in creating the unity of streets is the form of buildings located along the streets.
- When the buildings along the street have **varied forms, styles and treatment** the space loses definition.
